Vivari

Aquarium Care & Management

A Flutter application for tracking tanks, inhabitants, water parameters, and routine care schedules.

Built with Flutter

Vivien Alexey D. Razon

THE PROBLEM

Care Challenges

Aquarium care quietly asks for three kinds of memory.

When those details live in different notes or only in memory, it gets harder to spot what each tank needs.

WHEN?

Forgotten Schedules

Water change frequencies, filter cleaning, and dosing schedules easily slip past critical windows.

WHICH?

Scattered Records

Specific maintenance and water parameters tracked across notebooks, mobile notes, or memory alone.

WHAT?

Hidden Parameters

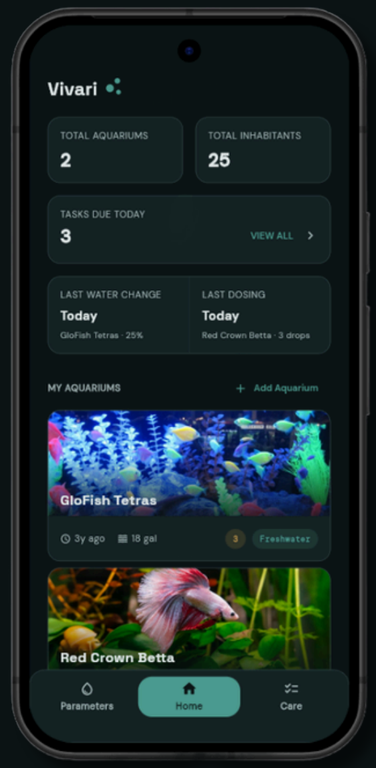

Difficulty spotting subtle water parameter drifts before ecosystem health suffers.

THE SOLUTION

CARE

HOW AI WAS USED

AI as a Development Assistant

GitHub Copilot

- Generated initial screen scaffolding & tab navigation
- Accelerated Care task creation & activity workflows
- Built local inhabitant catalog dataset & search logic

Codex Intelligence

- Assisted in structured Parameters overview layout
- Assisted with parameter range settings logic
- Connected parameter log entries to analytics history

HOW AI WAS USED

Personal Refinement

Core Data Models

Hand-crafted foundational data models for Aquariums, Care Records, and Water Readings to establish clean app state.

Unified App Theme

Created global design tokens for consistency.

Manual Code Review

Reviewed and modified all AI output: refined empty states, corrected layout overflows, and enhanced chart labeling.

CHALLENGES

Key Technical & Design Obstacles

Initial Scope Definition

Shifted from a rushed proposal to structured user flows (adding tanks, monitoring parameters, planning care).

Refined Scope

Visual Harmonization

AI screens varied in styling. Re-engineered components to strictly adhere to Vivari's central design theme.

Theme Enforced

Layout Overflow & Charting

Fixed pixel overflow issues and improved date axis labeling for historical trends.

Layout Fixed

WHAT'S NEXT

Future Roadmap Horizon

Push Notifications

Proactive automated mobile alerts when scheduled tasks or parameter checks are due.

PHASE 1

Live Species API

Connect local catalog to an external global species database API for expanded livestock data.

PHASE 2

AI Health Insights

Predictive health guidance based on historical parameter trends to support tank owners.

PHASE 3

Empowering Aquarium Care

Vivari provides a solid foundation for organizing, tracking, and reviewing everyday aquarium health.
